

Final Business Insights Report

1. Introduction

This project analyses sales, profit, customer behaviour, and shipping trends using Excel, SQL, and Power BI. The goal is to identify business performance patterns and generate useful insights for decision-making.

Dataset Overview

The dataset contains sales transaction details including product category, sales, profit, market, customer, and shipping information.

Key Business Insights

- APAC market generated the highest revenue.
- Furniture category showed lower profitability compared to Technology.
- Standard Class was the most frequently used shipping mode.
- Some products generated negative profit, indicating possible pricing or discount issues.
- Top-performing products contributed significantly to total profit.

Dashboard Summary

The Power BI dashboard provides visual analysis of sales trends, profit performance, regional revenue, and customer insights using interactive charts and filters.

Conclusion

The analysis helped identify profitable markets, weak-performing categories, and customer purchasing trends. These insights can support better pricing, shipping, and sales strategies.

Final Business Insights

- Sales performance varied across different markets and regions.
- Certain product categories generated higher profit compared to others.
- Some products showed negative profit, indicating loss-making items.
- Standard Class was the most commonly used shipping mode.
- Top-performing products contributed significantly to overall revenue.
- Customer purchasing trends and regional performance were identified through dashboard analysis.

- Interactive Power BI dashboards helped visualize sales, profit, and category performance effectively.
- SQL analysis improved understanding of business trends using aggregate functions and filtering techniques.
